RESPONSE UNDER 37 CFR §1.312

AMENDMENTS TO CLAIMS:

The listing of claims will replace all prior versions, and listings, of claims in the application:

LISTING OF CLAIMS:

1. (Previously presented) An electronic unit comprising a mechanical energy source, a generator driven by the mechanical energy source to generate induction electric power to supply electrical energy, and a rotation control unit driven by the electrical energy to control the rotation period of the generator, the rotation control unit comprising:

a brake control unit that compares a reference signal, generated according to a signal sent from a time reference source, with a rotation detection signal corresponding to the rotation period of the generator to apply brake control to the generator; and

a generator-stop preventing unit that sets the amount of brake applied to the generator to only a first brake setting value when a measured rotation period of the generator is equal to or longer than a first setting period, which is longer than a reference period, to prevent the generator from stopping.

- 2. (Original) An electronic unit according to Claim 1, wherein the first brake setting value is set to a value that makes the amount of brake applied zero.
- 3. (Original) An electronic unit according to Claim 1, wherein the first brake setting value is set to a value equal to or less than a minimum amount of brake selected from among a plurality of amounts of brake that can be set in the brake control unit.
- 4. (Original) An electronic unit according to Claim 1, wherein the generator-stop preventing unit sets the amount of brake applied to the generator to the first brake setting value in synchronization with the rotation period of the generator.
- 5. (Cancelled)
- 6. (Previously presented) An electronically controlled mechanical timepiece comprising a mechanical energy source, a generator driven by the mechanical

RESPONSE UNDER 37 CFR §1.312

energy source to generate induction electric power to supply electrical energy, a rotation control unit driven by the electrical energy to control the rotation period of the generator, and a time indication unit operated with the rotation of the generator, the rotation control unit comprising:

a brake control unit that compares a reference signal, generated according to a signal sent from a time reference source, with a rotation detection signal corresponding to the rotation period of the generator to apply brake control to the generator; and

- a generator-stop preventing unit that sets the amount of brake applied to the generator to only a first brake setting value when a measured rotation period of the generator is equal to or longer than a first setting period, which is longer than a reference period, to prevent the generator from stopping.
- 7. (Previously presented) A control program for an electronic unit comprising a mechanical energy source, a generator driven by the mechanical energy source to generate induction electric power to supply electrical energy, and a rotation control unit driven by the electrical energy to control the rotation period of the generator, the control program for the electronic unit controlling the rotation control unit to:

compare a reference signal, generated according to a signal sent from a time reference source, with a rotation detection signal corresponding to the rotation period of the generator to apply brake control to the generator; and

set the amount of brake applied to the generator to only a first brake setting value when a measured rotation period of the generator is equal to or longer than a first setting period, which is longer than a reference period, to prevent the generator from stopping.

8. (Previously presented) A recording medium recording a control program for an electronic unit comprising a mechanical energy source, a generator driven by the mechanical energy source to generate induction electric power to supply electrical energy, and a rotation control unit driven by the electrical energy to control the rotation period of the generator, the recorded control program for the electronic unit controlling the rotation control unit to:

RESPONSE UNDER 37 CFR §1.812

compare a reference signal, generated according to a signal sent from a time reference source, with a rotation detection signal corresponding to the rotation period of the generator to apply brake control to the generator; and

set the amount of brake applied to the generator to only a first brake setting value when a measured rotation period of the generator is equal to or longer than a first setting period, which is longer than a reference period, to prevent the generator from stopping.

9. (Previously presented) A control method for an electronic unit comprising a mechanical energy source, a generator driven by the mechanical energy source to generate induction electric power to supply electrical energy, and a rotation control unit driven by the electrical energy to control the rotation period of the generator, the control method comprising:

comparing a reference signal, generated according to a signal sent from a time reference source, with a rotation detection signal corresponding to the rotation period of the generator to apply brake control to the generator; and

setting the amount of brake applied to the generator to only a first brake setting value when a measured rotation period of the generator is equal to or longer than a first setting period, which is longer than a reference period, to prevent the generator from stopping.

10. (Currently amended) A method for manufacturing an electronic unit comprising a mechanical energy source, a generator driven by the mechanical energy source to generate induction electric power to supply electrical energy, and a rotation control unit driven by the electrical energy to control the rotation period of the generator, the method comprising:

selecting as an upper limit a period at which the generator is stopped unless the amount of brake applied to the generator is switched to a first brake setting value,

selecting as a lower limit a period at which the generator vibrates when the amount of brake applied to the generator is switched to the first brake setting value,

10/079,658

RESPONSE UNDER 37 CFR §1.312

and setting a first setting period to a period between the upper limit and the lower limit, such that the electronic unit operates to:

compare a reference signal, generated according to a signal sent from a time reference source, with a rotation detection signal corresponding to the rotation period of the generator to apply brake control to the generator; and

set the amount of brake applied to the generator to only athe first brake setting value when a measured rotation period of the generator is equal to or longer than athe first setting period, which is longer than a reference period, to prevent the generator from stopping.

11. (Previously presented) An electronic unit comprising a mechanical energy source, a generator driven by the mechanical energy source to generate induction electric power to supply electrical energy, and a rotation control unit driven by the electrical energy to control the rotation period of the generator, the rotation control unit comprising:

brake control means for comparing a reference signal, generated according to a signal sent from a time reference source, with a rotation detection signal corresponding to the rotation period of the generator to apply brake control to the generator; and

generator-stop preventing means for setting the amount of brake applied to the generator to only a first brake setting value when a measured rotation period of the generator is equal to or longer than a first setting period, which is longer than a reference period, to prevent the generator from stopping.
